HP migration services:
HP software feasibility study

More than ever, companies need to evolve their IT infrastructure to keep pace with business and market conditions that seem to change overnight. At the same time, companies are also faced with tremendous pressure to contain costs. Quite frankly, it’s a challenge. Fortunately, it’s a challenge that HP is ready to meet.

HP is at the forefront in developing technology, solutions and services that meet the needs of companies balancing migration and cost. To this end, HP offers a suite of porting services to move and maintain UNIX® software applications to the latest HP-UX or Linux environment. The very first step in this process is the HP Software Feasibility Study.
Move forward with agility

Using an established porting methodology, including the use of tools provided by HP Labs and other vendors, the HP Software Feasibility Study assesses application source code and defines the scope of work required to port applications from a UNIX-like operating environment to HP-UX or Linux. Whether you have a Solaris, AIX, Tru64 or another UNIX platform, HP can help you move forward quickly and with confidence. You’ll be able to:

- Leverage technology investments you’ve already made while gaining the speed and reliability of the latest technology
- Balance strategic business planning with timeliness and cost-effectiveness
- Get a feasibility document that will be used as a guide to port the application source code to the target operating system
- Increase accuracy and reduce the chance of errors with HP’s system that allows us to review porting issues up front

How it works

The HP Software Feasibility Study is designed expressly for applications with fewer than one million lines of source code. Experienced HP consultants will:

- Process the application source code through proven software tools as a basis for the porting analysis
- Conduct a porting review
- Provide feasibility study documentation that details the required code and recommended code changes
- Provide a porting project proposal

Service options

HP Services offers a full breadth of end-to-end solutions that go beyond the scope of this packaged service. Custom services are available to meet the specific requirements of your software porting needs. These include:

- More than one application (Solaris, AIX, Tru64 or another UNIX platform) in your assessment
- An application with more than one million lines of source code
